March 13, 2024

1 Introduction

In this assignment, I tried to implement some U-Net models with different loss functions to detect the head boundary in 2D ultrasound images, and then measure the head circumference.

2 Data Analysis

The dataset used in this study is the HC18 dataset. The training dataset consists of 999 2D ultrasound images of fetal head and the corresponding ground truth masks, whereas the test dataset consists of 335 2D ultrasound images of fetal head with no labels. For training the model, 80% of the training dataset will be used for training, 10% for validation, and 10% for testing to evaluate the model.

3 Model

Instead of building a model for segmentation, I used the U-Net model with different loss functions to generate new images of only the head boundary like the ground truth masks. After that, I utilized some image processing techniques to determine the contour of the head boundary and measure the head circumference.

3.1 U-Net Architecture

The U-Net model is a convolutional neural network for fast and precise segmentation of images. The architecture contains two paths: the contraction path (encoder) and the symmetric expanding path (decoder). The encoder is used to capture the context of the input image, while the decoder is used to enable precise localization.

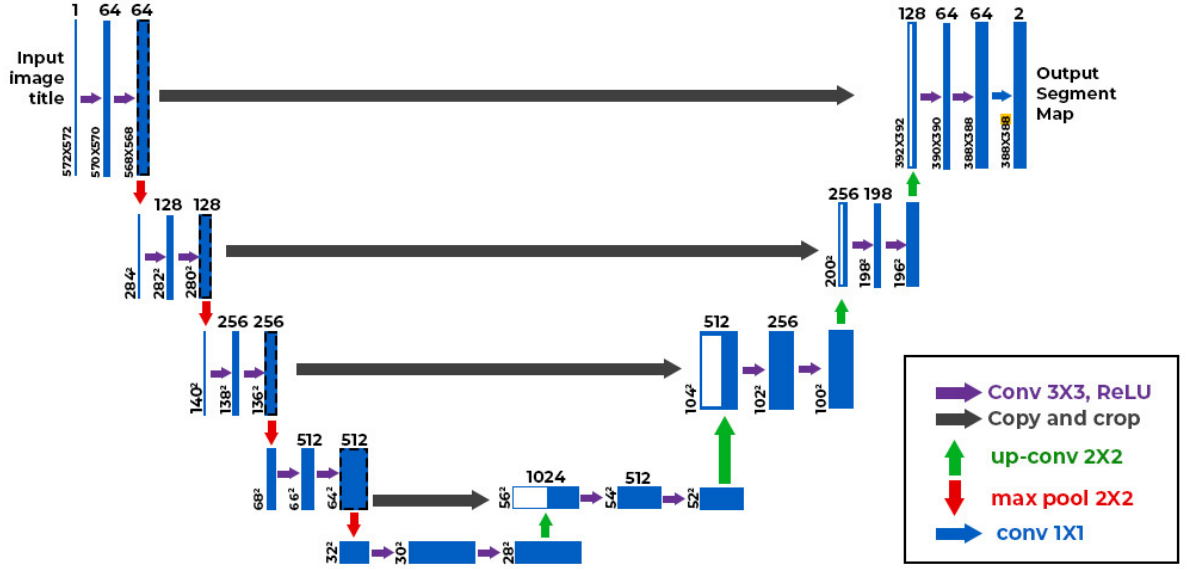

Figure 1: U-Net Architecture

3.2 Loss Functions

I used three loss functions to train the U-Net model: mean squared error (MSE), binary cross-entropy (BCE), and binary cross entropy combined with Intersection over Union (BCE + IoU). Firstly, the MSE loss function is used to measure the average of the squares of the errors between the predicted and ground truth masks. Next, I used the BCE loss function to measure the difference between the predicted and ground truth masks. Finally, a combination of BCE and IoU loss functions is an attempt to improve the performance of the model. The combination loss function is defined as follows:

$$MSE_{IoU} = \alpha * BCE + (1 - \alpha) * IoU \quad (1)$$

4 Results

4.1 For detecting the head boundary

Observing the loss values of the U-Net model with different loss functions, model with MSE loss has a decrease in loss value over time, while other cases didn't have significant changes in loss values. The U-Net model with MSE loss function seemed to achieve the best performance with the lowest MAE values in the metric evaluation.
